

II. AMENDMENTS TO THE CLAIMS

The following listing replaces any and all prior listings of the claims:

1. (Currently amended) A computerized data mining system, comprising:

at least one processing unit;

memory operably associated with the at least one processing unit; and

a data mining system storable in memory and executable by the at least one processing unit, the data mining system comprising:

a data exploration system for receiving and analyzing user data to provide statistical information about the user data;

a customized model system for generating and ranking customized data mining models, and for executing a selected customized data mining model on the user data, wherein the customized data mining models are generated in parallel using multiple iterations based on permutations of at least one of the user data, business parameters and a set of model generation algorithms,

wherein the customized model system comprises:

a model generation system for generating the customized data mining models in parallel using multiple iterations based on the permutations of at least one of the user data, the business parameters and the set of model generation algorithms;

a model ranking system for ranking the customized data mining models based on the business parameters, for identifying a predetermined quantity of the ranked customized data mining models, and for providing comparative data

corresponding to the predetermined quantity of the ranked customized data mining models;

a customized model selection system for selecting at least one customized mining model from the predetermined quantity; and

a customized model execution system for executing the selected at least one customized data mining model on the user data; and

an existing model system for selecting at least one existing data mining model from a library of existing data mining models, and for executing the selected at least one existing data mining model in parallel on the user data, and outputting a result.

2. (Original) The computerized data mining system of claim 1, further comprising:

a data submission system for submitting the user data; and

a parameter designation system for designating the business parameters.

3. (Cancelled)

4. (Original) The computerized data mining system of claim 1, wherein the existing model system comprises:

a model library system for assembling the library of existing data mining models based on the business parameters, and for displaying the library of existing data mining models and comparative data corresponding to the library of existing data models;

an existing model selection system for selecting the at least one existing data mining model from the library of existing data mining models;

an existing model execution system for executing the at least one existing data mining model on the user data in parallel; and

a existing model comparison system for comparing results of the execution of the at least one existing data mining model.

5. (Original) The computerized data mining system of claim 1, wherein the business parameters comprise a business taxonomy, a set of business problems and a set of model goals.

6. (Original) The computerized data mining system of claim 1, wherein the statistical information comprises data relationships, data outliers, invalid data values and standard deviations.

7. (Original) The computerized data mining system of claim 1, wherein the computerized data mining system is implemented in a network environment.

8. (Previously presented) A computerized system for generating and executing customized data mining models, comprising:

at least one processing unit;

memory operably associated with the at least one processing unit; and

a model generation system storable in memory and executable by the at least one processing unit, the model generation system comprising:

a model generation system for generating the customized data mining models in parallel using multiple iterations based on the permutations of at least one of user data, business parameters and a set of model generation algorithms;

a model ranking system for ranking the customized data mining models based on the business parameters, for identifying a predetermined quantity of the ranked customized data mining models, and for providing comparative data corresponding to the predetermined quantity of the ranked customized data mining models;

a customized model selection system for selecting at least one customized mining model of the customized data mining models; and

a customized model execution system for executing the selected at least one customized data mining model on the user data, and outputting a result.

9. (Original) The computerized system of claim 8, wherein the computerized data mining system is implemented in a network environment.

10. (Original) The computerized system of claim 8, wherein the business parameters comprise a business taxonomy, a set of business problems and a set of model goals.

11. (Currently amended) A computerized system for selecting and executing existing data mining models:

at least one processing unit;

memory operably associated with the at least one processing unit; and

a model selecting and executing system storable in memory and executable by the at least one processing unit, the model selecting and executing system ~~system~~ comprising:

a model library system for assembling a library of existing data mining models based on a business parameters, wherein the existing data mining models have been generated in parallel using multiple iterations, and for displaying the library of existing data mining models and comparative data corresponding to the library of existing data models;

an existing model selection system for selecting a plurality of existing data mining models from the library of existing data mining models;

an existing model execution system for executing the plurality of existing data mining models on the user data in parallel; and

an existing model comparison system for comparing results of the execution of the plurality of existing data mining models, and outputting a result.

12. (Previously Presented) The computerized system of claim 11, wherein the at least one plurality of existing data mining models is executed on the user data in a grid environment.

13. (Original) The computerized system of claim 11, wherein the business parameters comprise a business taxonomy, a set of business problems and a set of model goals.

14. (Previously presented) A computer-implemented method for generating customized data mining models, comprising:

providing user data and business parameters;

generating a plurality of customized data mining models in parallel using multiple iterations based on permutations of at least one of the user data, the business parameters and a set of model generation algorithms;

ranking the plurality of customized data mining models based on the business parameters;

selecting at least one customized data mining model from the ranked plurality of customized data mining models; and

executing the selected at least one customized data mining model on the user data, and outputting a result.

15. (Original) The computer-implemented method of claim 14, further comprising:

identifying a predetermined quantity of the ranked plurality of customized data mining models; and

providing comparative data corresponding to the predetermined quantity of the ranked plurality of customized data mining models, prior to the selecting step.

16. (Previously presented) The computer-implemented method of claim 14, wherein the step of generating comprises:

forming multiple permutations of at least one of the user data, the business parameters and the set of model generation algorithms; and

generating a plurality of customized data mining models using multiple iterations in a grid environment based on the multiple permutations.

17. (Original) The computer-implemented method of claim 14, wherein the statistical information comprises data relationships, data outliers, invalid data values and standard deviations.

18. (Original) The computer-implemented method of claim 14, wherein the business parameters comprise a business taxonomy, a set of business problems and a set of model goals.

19. (Previously presented) A computer-implemented method for selecting existing data mining models, comprising:

providing user data and business parameters;

assembling a library of existing data mining models based on the business parameters, wherein the existing data mining models have been generated in parallel using multiple iterations;

displaying the library of existing data mining models and comparative data corresponding to the library of data mining models;

selecting a plurality of existing data mining models from the library of existing data mining models;

executing the plurality of existing data mining models on the user data in parallel; and

comparing results of the execution of the plurality of existing data mining models, and outputting a result.

20. (Original) The computer-implemented method of claim 19, wherein the business parameters comprise a business taxonomy, a set of business problems and a set of model goals.

21. (Currently amended) A computer-readable medium storing computer instructions, which when executed, enables a computer system to mine data, the computer instructions comprising: mining computer program product stored on a recordable medium, which when executed, comprises:

~~program code for~~ receiving and analyzing user data to provide statistical information about the user data;

~~program code for~~ generating and ranking customized data mining models, and for executing a selected customized data mining model on the user data, wherein the customized data mining models are generated in parallel using multiple iterations based on permutations of at least one of the user data, business parameters and a set of model generation algorithms,

wherein the generating and ranking comprises:

generating the customized data mining models in parallel using multiple iterations based on the permutations of at least one of the user data, the business parameters and the set of model generation algorithms;

ranking the customized data mining models based on the business parameters, for identifying a predetermined quantity of the ranked customized data mining models, and for providing comparative data corresponding to the predetermined quantity of the ranked customized data mining models;

selecting at least one customized mining model from the predetermined quantity; and

executing the selected at least one customized data mining model on the user data; and

selecting at least one existing data mining model from a library of existing data mining models, and for executing the selected at least one existing data mining model in parallel on the user data, and outputting a result.

22. (Currently amended) The computer-readable medium storing computer instructions ~~data mining computer program product~~ of claim 21, wherein the instructions further comprising ~~comprise:~~

~~program code for~~ submitting the user data; and

~~program code for~~ designating the business parameters.

23. (Cancelled)

24. (Currently amended) The computer-readable medium storing computer instructions ~~data mining computer program product~~ of claim 21, wherein the ~~program code for~~ selecting comprises:

~~program code for~~ assembling the library of existing data mining models based on the business parameters, and for displaying the library of existing data mining models and comparative data corresponding to the library of existing data models;

~~program code for~~ selecting the at least one existing data mining model from the library of existing data mining models;

~~program code for~~ executing the at least one existing data mining model on the user data in parallel; and

~~program code for~~ comparing results of the execution of the at least one existing data mining model.

25. (Currently amended) The computer-readable medium storing computer instructions ~~data mining computer program product~~ of claim 21, wherein the business parameters comprise a business taxonomy, a set of business problems and a set of model goals.

26. (Currently amended) The computer-readable medium storing computer instructions ~~data mining computer program product~~ of claim 21, wherein the statistical information comprises data relationships, data outliers, invalid data values and standard deviations.

27. (Currently amended) The computer-readable medium storing computer instructions ~~data mining computer program product~~ of claim 21, wherein the ~~program product is~~ computer instructions are implemented in a network environment.

28. (Currently amended) A ~~computer-readable program product stored on a recordable medium~~ storing computer instructions, which when executed, enables a computer system to generate and execute for generating and executing customized data mining models, which when executed comprises the computer instructions comprising:

~~program code for~~ generating the customized data mining models in parallel using multiple iterations based on the permutations of at least one of user data, business parameters and a set of model generation algorithms;

~~program code for~~ ranking the customized data mining models based on the business parameters, for identifying a predetermined quantity of the ranked customized data mining models, and for providing comparative data corresponding to the predetermined quantity of the ranked customized data mining models;

~~program code for~~ selecting at least one customized mining model from the predetermined quantity; and

~~program code for~~ executing the selected at least one customized data mining models on the user data, and outputting a result.

29. (Currently amended) The computer-readable medium storing computer instructions ~~program~~ ~~product~~ of claim 28, wherein the ~~program product is~~ instructions are implemented in a network environment.

30. (Currently amended) A computer-readable program product stored on a recordable medium storing computer instructions, which when executed, enables a computer system to select and execute for selecting and executing existing data mining models, which when executed ~~comprises the computer instructions comprising:~~

~~program code for~~ assembling a library of existing data mining models based on business parameters, wherein the existing data mining models have been generated in parallel using multiple iterations, and for displaying the library of existing data mining models and comparative data corresponding to the library of existing data models;

~~program code for~~ selecting a plurality of existing data mining models from the library of existing data mining models;

~~program code for~~ executing the plurality of existing data mining models on the user data in parallel; and

~~program code for~~ comparing results of the execution of the plurality of existing data mining models, and outputting a result.

31. (Currently amended) The computer-readable medium storing computer instructions ~~program~~ ~~product~~ of claim 30, wherein the plurality of existing data mining models is executed on the user data in a grid environment.

32. (Currently amended) The computer-readable medium storing computer instructions ~~program~~ ~~product~~ of claim 30, wherein the business parameters comprise a business taxonomy, a set of business problems and a set of model goals.
